Meeting summary

Quick recap

The meeting focused on organizing the team's workflow and technical setup for their project. Khushi shared a starter plan generated by Claude to divide work and suggested tracking contributions on GitHub in a week-by-week document. Vaishnavi and Matthew discussed the technical approach, agreeing to use a single AWS account and VPC for easier communication, and decided to use a local .env file and an env example file to manage credentials. They also discussed whether to use a single repository or multiple repositories for microservices, leaning toward a single repository for simplicity. The team agreed to meet weekly on Saturdays at 11 am and discussed using Zoom's AI companion for meeting transcripts. Finally, they briefly talked about the uncertainty regarding whether their next class would be online or offline.

Next steps

Matthew

- Create AWS credentials for Vaishnavi and Khushi.
- Set up a recurring weekly meeting for Saturdays at 11 AM.
- Enable Zoom AI companion recording/transcription for future meetings.

Vaishnavi

- Write down the work division in the group chat, including what she is doing, what Matthew is doing, and what Khushi should do.
- Create a document on GitHub to track contributions week by week.

Collaboration

- Vaishnavi and Matthew: Proceed with the front-end work and create an S3 bucket.
- Team: Use a single AWS account (Matthew's) and a single VPC for the project.
- Team: Maintain a local .env file for credentials and an .env example file in the repository.

Summary

Project Work Division and Setup

The team discussed dividing work for their project, with Khushi proposing to use a weekly documentation approach similar to her software engineering class on GitHub. They agreed to use a single AWS account managed by Matthew, who offered to create credentials for the team. The group decided to proceed with front-end development and S3 bucket creation, with Matthew handling email communications and available until 5 PM for questions.

AWS Credentials and Documentation Planning

The team discussed implementing a shared .env file for credentials that would be managed through AWS Secrets Manager, with Matthew offering to use his AWS account. They agreed to establish weekly Saturday 11am meetings, with Khushi suggesting they document tasks and responsibilities on GitHub to track progress week by week. The team also discussed API documentation, with Khushi offering to help write the API docs after seeing what tasks each team member would handle.

AI Companion and Meeting Updates

Matthew explained that he has access to an AI companion in NYU's Enterprise Zoom that can record meetings and generate transcripts, which could help with submitting weekly requirements. The group discussed uncertainty about whether their next class meeting would be online or offline, with no specific details provided yet about time or location. They agreed to wait for an email or notification about the meeting details, likely to be received by the next morning.

Attendees: Matthew J Boubin (Organizer), Vaishnavi Rathod, Khushi Agarwal
